SEROLOGY AND IMMUNOLOGY

Herpes Simplex Virus 2 IgG - Serum (Serum)

HSV 2 IgG 0.34 Negative : < 0.9 Index
CLIA Borderline : 0.9 – 1.1
Positive : > 1.1

Interpretation:

The Herpes Simplex Virus (HSV) is a member of the Herpesviridae family, of which two types are known: Type 1 (HSV-1) and Type 2 (HSV-2) which present slight antigenic differences. HSV-1 causes chiefly oral-facial lesions, while HSV-2 is mainly responsible for genital lesions, but this distinction is not binding, both types occasionally causing infection in either anatomical site. HSV may also cause a form of ocular keratitis and lesions of the central nervous system. The primary infection is often a subclinical form and is rarely diagnosed. After a latency period of variable duration, reactivation may occur and viral replication may or may not give rise to clinical lesions. Infection contracted during birth is of particular interest, this being an important cause of morbidity and mortality. It is therefore important to determine the immunity state of women during pregnancy in order to detect serum conversion. The assay of specific IgG is important to establish the serological state of the patient. All the positive results require a careful interpretation. The test cannot be used as the only method for a clinical diagnosis. Negative results may not exclude an eventual infection. The test result should be used in conjunction with information available from evaluation of the case history or other diagnostic procedures. For Borderline results, second sample obtained 8-14 days later should be tested in parallel to determine an increase in the IgG antibody level.

Dr. G. Amitha
MBBS, MD (MICROBIOLOGY)
Consultant Microbiologist

Disclaimer:

1. All results released pertain to the specimen as received by the lab for testing and under the assumption that the patient indicated or identified on the bill/test requisition form is the owner of the specimen.
2. Clinical details and consent forms, especially in Genetic testing, histopathology, as well as wherever applicable, are mandatory to be accompanied with the test requisition form. The non-availability of such information may lead to delay in reporting as well as misinterpretation of test results. The lab will not be responsible for any such delays or misinterpretations thereof.
3. Test results are dependent on the quality of the sample received by the lab. In case the samples are preprocessed elsewhere (e.g., paraffin blocks), results may be compromised.
4. Tests are performed as per the schedule given in the test listing and in any unforeseen circumstances, report delivery may be affected.
5. Test results may show inter-laboratory as well as intra-laboratory variations as per the acceptable norms.
6. Genetic reports as well as reports of other tests should be correlated with clinical details and other available test reports by a qualified medical practitioner. Genetic counselling is advised in genetic test reports by a qualified genetic counsellor,
